

## Additions to the List of Newton Noctuidæ.

The following names are to be added to those given in the list on p. 34-39 of the present volume of *PSYCHE*; the abbreviations are the same as in that list.

Au.<br/> <i>Galgula hepara.</i> One s. Nov.<br/> <i>Catocala neogama.</i> R. s. q. Au.<br/>               <i>piatriæ.</i> R. q. s. Au. Sp.<br/> <i>Homoptera Woodii</i> (Grote, Can. Entom., ix, 88-89). R. l. Jl.<br/> <i>Spargoloma 6-punctata.</i> R. l. Jl.</p> |
|--|--|

The new species mentioned in the above list is described as follows, by Mr. Grote:—

*Glæa deleta* n. sp. ♂. Belongs, with *G. tremula*, to the section which I have called *Epiglæa*, in which the thorax has a sharp scale-ridge. Resembles *G. viatica* at first sight, but belongs with *G. pastillicans* to a different section of the genus. Expanse, 46 mm. Of the same color as *G. viatica*, but smaller, and with the transverse posterior line punctate, and the subterminal also broken into spots. Stigmata pale ringed, well sized, concolorous; reniform stained at base. The markings are faint. Hind wings fuscous above; with discal spot and line beneath. Antennæ white at base. Abdomen with ochery anal hairs. (*A. R. Grote.*)

Rare, at sugar, in September. Several (poor) specimens were taken at sugar in October.

Noctuae have been abundant here this fall. Besides the additional species of *Lithophane* mentioned above, I have taken all those given in my former list. The larvæ of *Lithophane disposita* and *L. Bethunei* were found last June at the roots of apple and willow trees.

*R. Thaxter.*
